Why Tricentis Test Management for Jira?

Jira wasn't designed for testing. TTM for Jira puts QA and development teams directly in the same environment, so they can collaborate on testing and improve quality.

Other test management plugins don't scale. Too many test objects slow down the Jira instance for everyone using it.

Gain access to world class expertise. Tricentis works daily with organizations of all types to transform testing and achieve success with their toolkit.

Top 3 key features

1. Testing-specific functionality within Jira

Create, define, re-use and clone test steps, structure project folders however you need, track test executions, log defects, and report on test performance all within the same environment used by developers and business users.

2. Scale test management without deterioration

Test Management for Jira remains fast and responsive as the number of users, test projects, and objects grows. Services hosted by Tricentis outside of the Jira infrastructure allows the core UI to perform at scale.

3. The flexibility to evolve

The familiar Jira interface makes it easy to stand up QA workflows and inputs, as well as onboard new team members seamlessly. If you grow to need greater workflow customization or compliance measures, our migration utility offers a smooth transition to Tricentis qTest Pro or Enterprise.

What sets Tricentis Test Management for Jira apart

Free your team from spreadsheets. Manually planning, reporting, and logging changes through wikis or spreadsheets compromises the true value of your highly-skilled team. With a dedicated solution like Tricentis Test Management for Jira, you can drive quality as one team, minimize risk, and ensure faster delivery.

Better assess release readiness. View pass/fail rates, execution progress, enable forward and backward traceability and more. You can also see how tests perform across various versions, testers, and other components.

Centralize and standardize quality. A unified hub for test management lets you standardize processes and best practices across the enterprise, all while maintaining alignment among testing, developer, and business teams.

Shift toward Agile. Agile workflows demand collaboration, transparency, and documentation. TTM for Jira enables you to share project-level and granular detail around testing with all stakeholders.

Deliver business value

Release faster and remove the testing bottleneck by enhancing collaboration, enabling scale, and standardizing best practices.

Better informed go/no-go decisions save millions otherwise lost to hypercare, defect resolution, lost opportunities, and reputational damage.

Drive productivity and reduce context switching with a trusted solution and a streamlined toolset that keeps stakeholders aligned to a single source of truth.

Objection handling

"I thought Jira extensions were too lightweight for test management."

While many Jira extensions for test management have limited features and difficulty scaling, TTM for Jira is designed for usability and performance at scale, while including capabilities important to test case management.

"Why should I choose a new Jira extension for test management over a more established alternative?"

TTM for Jira builds on years of Tricentis' experience with Agile test management and adds a friendly UI to keep QA, dev, and product easily collaborating in the same environment. Tricentis is also in the process of adding major new capabilities, with direct feedback from customers and partners.

"I need a solution that supports managing test automation, integrates with CI/CD, and has APIs."

Great! Support for test automation management, integration with CI/CD tools, APIs, and query language are all planned for delivery within TTM for Jira in the near future.

Test functionality you can't get with just Jira

- ▶ Reuse test cases
- ▶ Create testing-specific reports
- ▶ Group test cycles and executions
- ▶ Link cases to Jira stories
- ▶ Associate bugs with test steps
- ▶ Scale test objects and data without disruption

Role	Message
Technology leader Reports to CEO. Manages QA. May oversee DevOps.	▶ Free up your team for innovative, higher-value work. ▶ Foster collaboration to drive business value in each release. ▶ Stop cluttering your stack with workaround solutions that can't scale. ▶ Transform testing from a cost center to a value-add for the entire organization.
QA leader Reports to VP. Manages tactical testers.	▶ Make better decisions with better risk readiness assessments. ▶ Lay the foundation for growth by standardizing best practices. ▶ Accelerate testing cycles to support automation and DevOps goals while reducing risk.
